Rationale

- How does life expectancy sex gap prevail across different sub-national levels in Australia?
- How does this dynamic at the sub-national level affect the life expectancy sex gap at the national level?

Time trends in life expectancy sex gap at age 25, 1945-2020

Source: Calculation based on HMD(2021)

Looks good, but?

Data

Death registration in 2016-2017 linked to Census 2016 results through Multi-Agent Data Integration Project (MADIP) (Korda et al., 2020; Welsh et al., 2021)

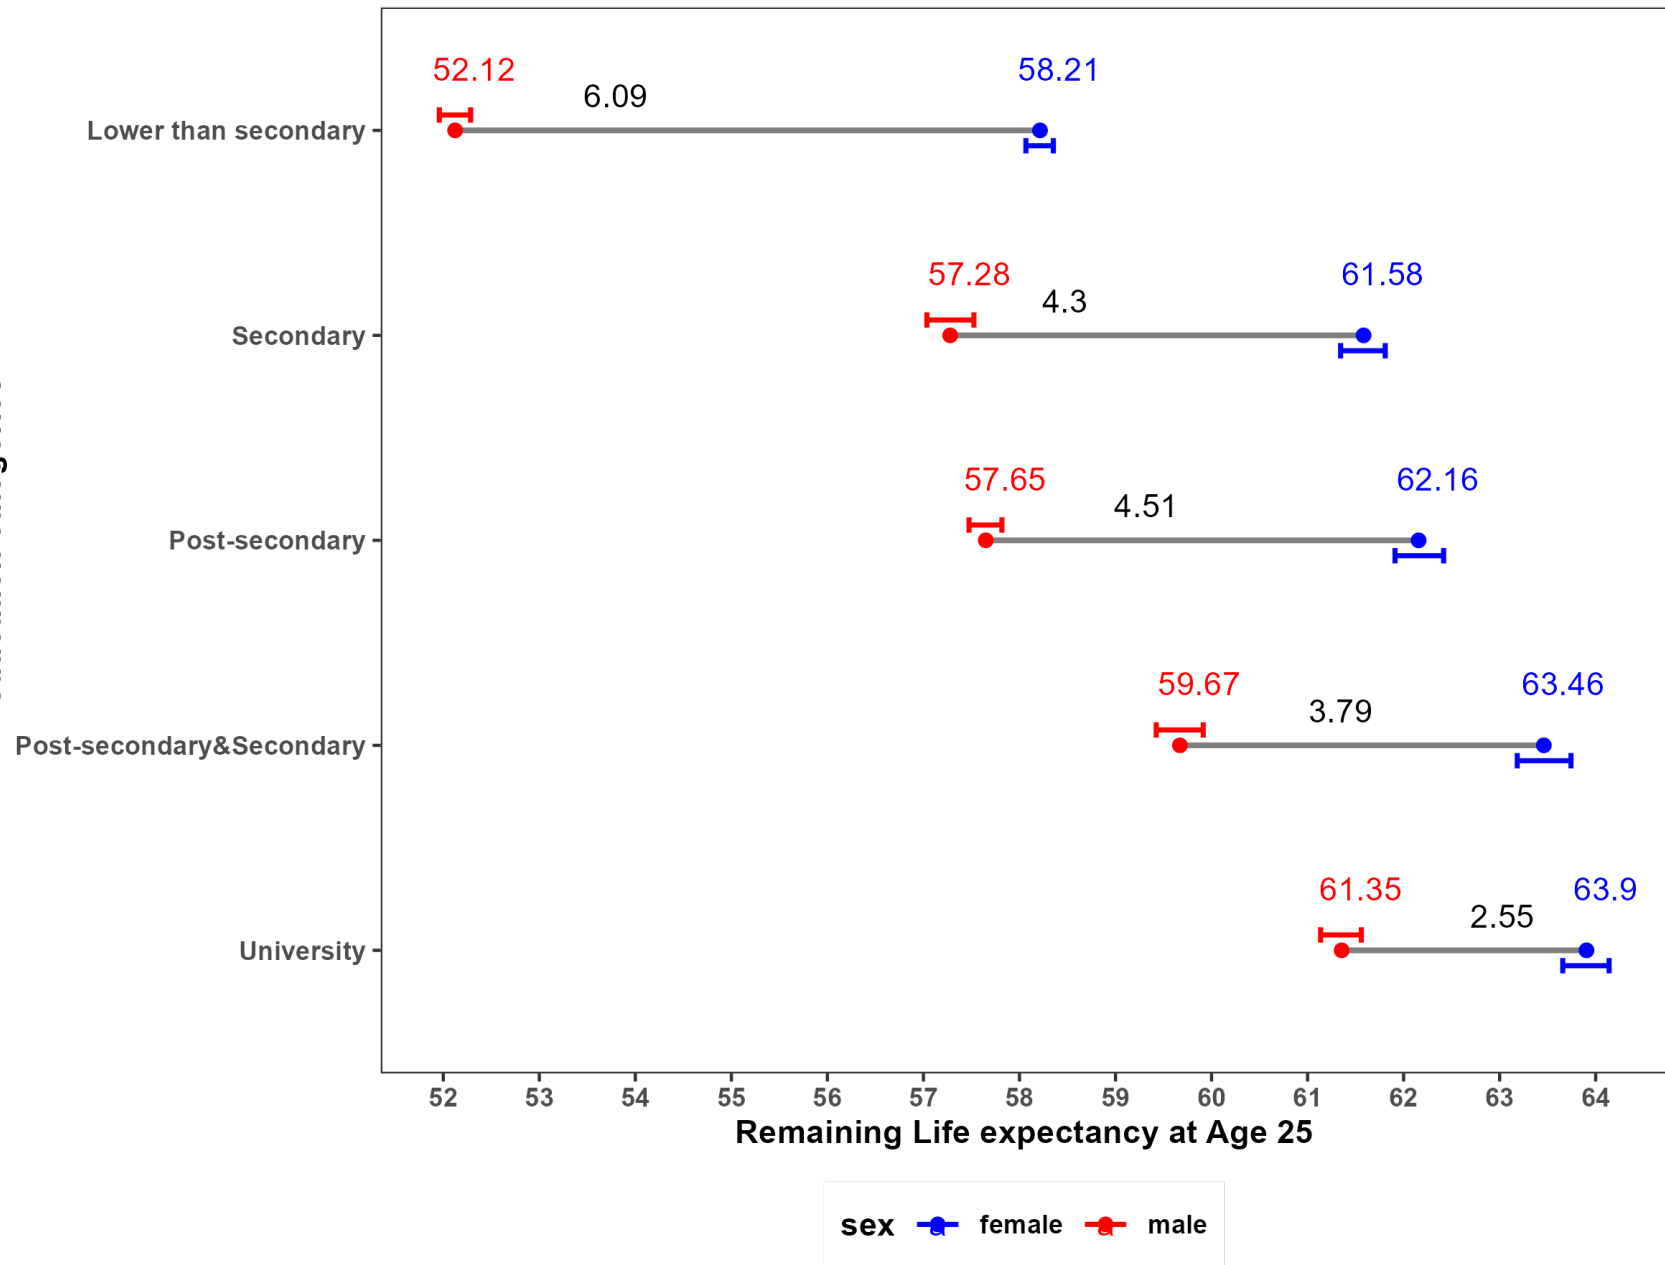

Number of deaths and Population estimates for each education levels smoothed with Penalized-composite link model (Rizzi et al., 2015).

Why Education?

education categories

Life expectancy sex gap by education level, 2016

Source: MADIP (2021)

Methods

$$m(x) = \sum_i m(x, i) c(x, i)$$

$m(x, i)$ is sub-population-specific mortality rates, and $c(x, i)$ is sub-population composition

Education ■ University Education ■ Post-secondary & Secondary ■ Post-secondary ■ Secondary ■ Lower than secondary

Source: Calculation based on MADIP (2021)

Figure 1. Population pyramid from age 25 by education level, Australia 2016

Source: Calculation based on MADIP (2021)

How would this change anything?

$$\dot{e}_{25} = \Delta \textit{mortality} + \Delta \textit{composition}$$

$$\dot{e}_{25} =$$

$$- \int_{25}^{\omega} \sum_i e^{-\int_{25}^x \sum_i m_{a,i} c_{a,i} da} \int_{25}^x \dot{m}_{a,i} c_{a,i} da dx$$

$$- \int_{25}^{\omega} \sum_i e^{-\int_{25}^x \sum_i m_{a,i} c_{a,i} da} \int_{25}^x m_{a,i} \dot{c}_{a,i} da dx$$

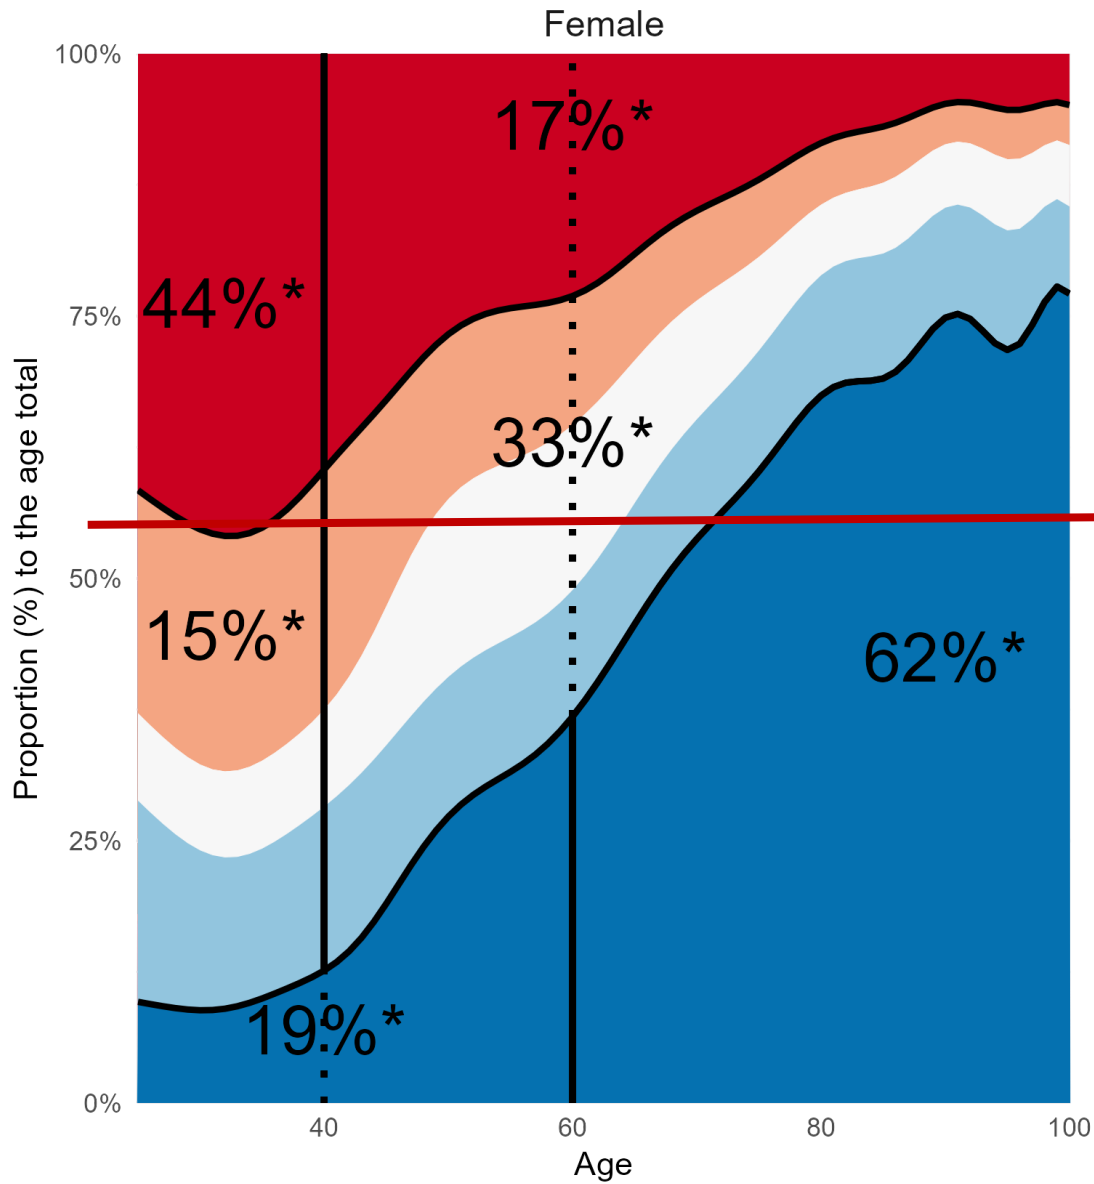

A. Australia 2016

<i>Female life expectancy</i>	59.91 (59.84, 59.97)
<i>Male life expectancy</i>	56.06 (56.00, 56.13)
<i>Δ Mortality</i>	4.45 (4.36, 4.54)
<i>Δ Composition</i>	-0.67 (-0.67, -0.66)
<i>Total</i>	3.78 (3.69, 3.87)

The negative composition effect

Education ■ University Education ■ Post-secondary & Secondary ■ Post-secondary ■ Secondary ■ Lower than secondary

B. Hypothetical Scenario

<i>Female life expectancy</i>	61.86 (61.80, 61.91)
<i>Male life expectancy</i>	57.71 (57.64, 57.77)
<i>Δ Mortality</i>	3.73 (3.65, 3.82)
<i>Δ Composition</i>	0.41 (0.40, 0.41)
<i>Total</i>	4.14 (4.05, 4.23)

Increasing life expectancy.

Widening gap and positive composition effect.

Discussion

1. The importance of SES composition (e.g. education, income, occupation).
2. Possible scenario for the future
3. Heterogeneity, and making public health observations.

Future Directions

Differences across time?

Impact from pandemic?
